ORGANIZATION OF SCCs

The four levels of source descriptions for SCCs are associated with the first 1, 3, 6, and 8 digits of the codes, (for the point source codes used by AFS - the AMS codes require 3, 5, 8, and 11 digits, including a leading "A"). The first level uses only the first digit and provides only the most general information on the category of the emissions.

The second level of description is associated with the first three digits, and subdivides the five major categories above into major industry groups. For example, 1-01 indicates External Combustion in Utility Boilers, and 1-02 indicates External Combustion in Industrial Boilers. The Manufacturing Processes category (3-) is currently divided into 21 industry classes, such as Chemical Manufacturing (3-01), Food and Agriculture (3-02), and Primary Metal Production (3-03).

The third level of description requires the first six digits to be specified, and it identifies a specific industry or emission source category, e.g., Cotton Ginning (3-02-004), or Primary Copper Smelting (3-03-005). The three digits which have been added to the industry class description (the first three digits) usually indicate the major product, raw material, or fuel used.

The fourth level of description is associated with the full eight digit code. The addition of two more digits beyond the third level specifies the particular emitting process within the third-level source category. For example, SCC 3-03-005-06 specifies the Ore Concentrate Dryer emission source at a Primary Copper Smelting facility (3-03-005).

An eight-digit code may correspond to a particular boiler type, process heater, process vent, or fuel. A single emission point may have two or more SCCs if it uses more than one material or burns more than one type of fuel, but most emission points will be described by one SCC.
